

ViscoCheck

Lube Oil Quality Test

- Checking the viscosity by comparing fresh and used oil

Order No.: 1055

For cleaning the tools above we recommend using #1027 Cleaning Agent

Viscosity is one of the most important parameters of lubrication oils to be checked on a frequent base.

A deterioration of the viscosity can lead to severe operational problems of any kind of lubricated machinery.

Dilution by fuel or the oxidation of a lubrication oil are only two reasons out of many which might have a greater impact on the viscosity. The **Visco Check** is an easy to use tool to get a fast and reliable evidence on this important parameter.

Just compare a fresh oil sample – which is taken as viscosity reference – and a sample of the oil to be tested and after a few minutes of preparation and testing you have already a clear statement about the quality of the oil in use.
